Revised: 12/2/2019

Files and Filesystem Navigation

Michael C. Hackett
Computer Science Department

Community College of Philadelphia

Lecture Topics

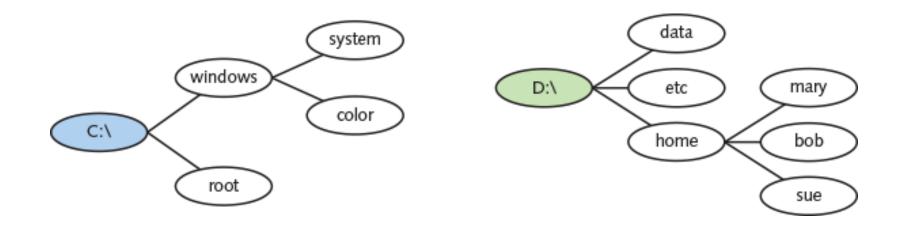

- Linux Directory Structure
 - Filesystem Hierarchy Standard
 - Navigating Directories
- Files and Directories
 - File Types
 - Filenames
 - Listing Files and their Types
 - Wildcard Metacharacters

- Displaying text files
- Displaying binary files
- Searching for text in files
- Editing text files
 - The vi Editor
- Additional text processing tools

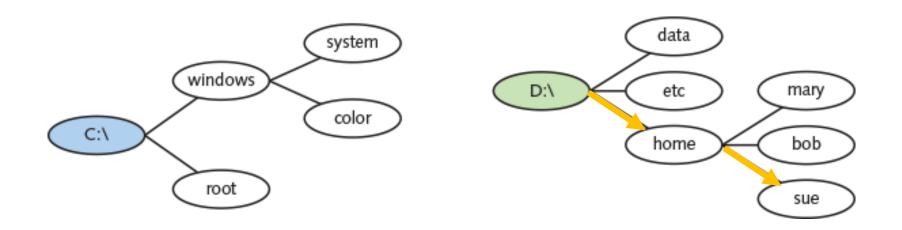

- Linux uses a logical directory tree to organize files into directories (or folders)
 - Directories are special types of files used by the filesystem to organize other files in the logical directory tree.

 When files are stored into a directory, the file is stored in the filesystem of a hard drive partition.

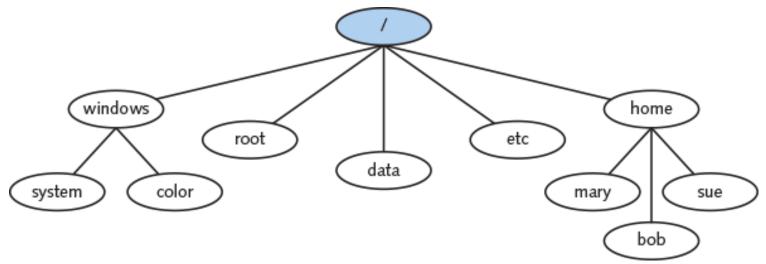

- You may be familiar with the Windows directory tree structure.
 - Each partition is given a drive letter like C: or D:
 - Has a root directory indicated by the \ character

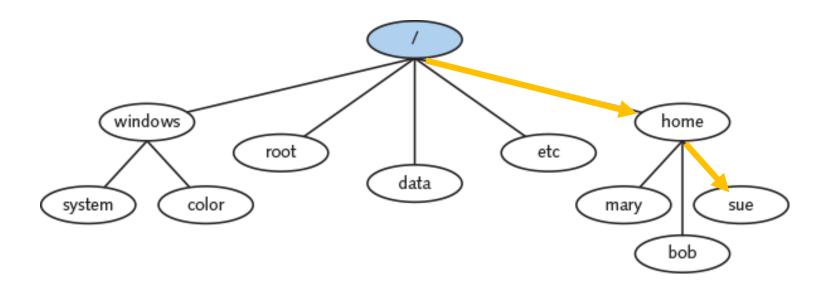

- The absolute pathname is the full path to a file or directory, beginning at the root directory.
 - D:\home\sue

- Linux uses a similar structure, but without drive letters.
 - Contains a single root directory, identified by the character / (not \ like in Windows)
 - Partitions and drives are mounted (or "attached") to directories in the directory tree.

- Absolute path to /home/sue
 - Use forward slash / in Linux; (Backslash \ on Windows)

• The Filesystem Hierarchy Standard (FHS) specifies the names of files and directories (and their locations) on Linux systems.

 Makes systems compatible with each other, since they'll know where certain files and directories should be

https://refspecs.linuxfoundation.org/fhs.shtml

 The top-most directory in a Linux filesystem, as shown in previous slides) is the root directory, represented by a single forward slash /

- Below the root directory are numerous, standardized folders
 - Consistent across almost every Linux distribution
 - Some distributions many include additional folders

- /bin Executable command-line (binary) programs and utilities
 - The 1s command (seen in the previous lecture) is stored here:
 /bin/1s
- /boot Files used to boot the operating system
- /dev Hardware and software device drivers; files that represent devices connected to the system
 - The second partition of the first SATA hard disk would be represented in this directory as: /dev/sda2

- /etc Configuration files
 - For example, the file that contains DNS Server information to the system is contained in /etc/resolv.conf
- /home User home directories
 - A user named student would (typically) have the following home directory: /home/student
- /lib Software/program libraries used by the kernel, utilities, and other programs.

- /media Mount points for removable media like CD-ROMs
- /mnt Mount point for temporarily mounted filesystems
- /opt Additional/optional files required by programs installed on the system
- /proc A virtual filesystem that contains files that are continually updated with kernel information
- /root Home directory of the root user
 - Normal users have home directories as individual subdirectories in /home

- /sbin Programs used in the boot process and the root user
- /sys A virtual filesystem that stores information about devices
- /tmp Temporary files
- /usr Small programs and files accessible by all users
 - Contents are read-only
- /var Files that constantly change as the system runs.
 - Log files, for the most part

A listing of the root directory on Fedora 31

```
[mhackett@localhost ~1$ ls /
                lib64
                       mnt
         home
bin
     dev
                            proc
                                  run
                                         srv
                                                   var
                 media opt root sbin
          lib
boot
     etc
                                         SUS
                                              usr
```

Navigation

- After logging in, you are normally placed in your home folder in the directory tree.
 - Regular users: /home/username
 - Root (superuser) account: /root

- The ~ metacharacter is used by the shell to refer to the current user's home directory.
 - Works for both regular users and root

Navigation

Logging in as a normal user:

```
localhost login: mhackett
Password:
Last login: Sat Nov 30 15:13:49 on tty2
[mhackett@localhost_~1$
```

Logging in as root:

```
localhost login: root
Password:
Last login: Sat Nov 30 15:42:30 on tty2
[root@localhost~]#_
```

Navigation – Current Location

- To print the current directory you are in, enter the pwd command.
 - "Print Working Directory"
 - No options or arguments needed.

```
localhost login: mhackett
Password:
Last login: Sun Dec 1 13:49:47 on tty2

[mhackett@localhost ~1$ pwd
/home/mhackett

[mhackett@localhost ~1$ _

[mhackett@localhost ~1$ _

[mhackett@localhost ~1$ _

[mhackett@localhost ~1$ _

[root@localhost ~1# _

[root@localhost ~1# _
```

- The command used to navigate into a different directory is the cd command.
 - "Change Directory"

cd [argument]

Argument is the directory you wish to navigate to.

 The command cd / would navigate you to the filesystem hierarchy's root directory.

```
[mhackett@localhost ~1$ pwd

/home/mhackett

[mhackett@localhost ~1$ cd /

[mhackett@localhost /1$ ls

bin dev home lib64 mnt proc run srv tmp var

boot etc lib media opt root sbin sys usr

[mhackett@localhost /1$ pwd

/

[mhackett@localhost /1$ _
```

 From here, we could navigate into the var subdirectory with the command cd var

```
[mhackett@localhost /]$ pwd
[mhackett@localhost /]$ cd ∪ar
[mhackett@localhost var]$ pwd
/var
[mhackett@localhost var]$ ls
                            kerberos local log nis preserve spool
account cache db
                  ftp
                                                                       шшш
        crash empty games lib
                                      lock
                                            mail opt
                                                      run
                                                                tmp
                                                                       yp
[mhackett@localhost var]$
```

 From here, we could navigate into the log subdirectory with the command cd log

```
[mhackett@localhost var]$ pwd
/var
[mhackett@localhost var]$ ls
account cache db
                             kerberos
                       ftp
                                        local
                                               log
                                                     nis preserve spool
                                                                           WWW
        crash empty games lib
                                        lock
                                              mail opt run
                                                                    tmp
                                                                           uр
[mhackett@localhost var]$ cd log
[mhackett@localhost log]$ pwd
/var/log
[mhackett@localhost log]$ ls
anaconda chrony
                                       hawkey.log
                                                    libuirt
                          dnf.rpm.log
                                                             samba
                                                                                tallylog
audit
                           firewalld
                                       httpd
                                                             speech-dispatcher
                                                                                wtmp
         cups
                                                    ppp
                                                    private sssd
boot.log dnf.librepo.log gdm
                                        journa l
btmp
         dnf.log
                          glusterfs
                                        lastlog
                                                    README
                                                             swtpm
[mhackett@localhost log]$
```

 To navigate quickly back to your home directory, enter the cd command without any arguments.

```
[mhackett@localhost log]$ pwd
/var/log
[mhackett@localhost log]$ ls
anaconda chrony
                           dnf.rpm.log hawkey.log
                                                    libuirt samba
                                                                                 tallylog
audit
                           firewalld
                                        httpd
                                                             speech-dispatcher
                                                                                 wtmp
         cups
                                                    ppp
boot.log dnf.librepo.log gdm
                                        journa l
                                                    private sssd
         dnf . log
                          alusterfs
                                        lastlog
                                                    README
                                                             swtpm
[mhackett@localhost log]$ cd
[mhackett@localhost ~1$ pwd
/home/mhackett
[mhackett@localhost ~1$
```

- The following would also work to return to your home directory:
 - cd ~

- We can move back to the /var/log directory, by entering
 cd /var/log
 - We provide the cd command with the absolute path.
 - The previous examples used *relative* paths; We moved based on where we currently were in the filesystem.

```
[mhackett@localhost log1$ cd
[mhackett@localhost ~1$ pwd
/home/mhackett
[mhackett@localhost ~1$ cd /var/log
[mhackett@localhost log1$ pwd
/var/log
[mhackett@localhost log1$ _
```

• To move up one directory, enter

```
cd ..
```

• The .. metacharacter is used to refer to the current directory's parent.

```
[mhackett@localhost log]$ pwd
/var/log
[mhackett@localhost log]$ cd ..
[mhackett@localhost var]$ pwd
/var
[mhackett@localhost var]$ _
```

 From this location, (/var) we could move to the Downloads directory in our home directory using the following commands

cd ~/Downloads

```
[mhackett@localhost var]$ pwd

/var

[mhackett@localhost var]$ cd ~/Downloads

[mhackett@localhost Downloads]$ pwd

/home/mhackett/Downloads

[mhackett@localhost Downloads]$
```

 From here, we could move up two directories with the following command

```
cd ../..
```

```
[mhackett@localhost Downloads]$ pwd
/home/mhackett/Downloads
[mhackett@localhost Downloads]$ cd ../..
[mhackett@localhost home]$ pwd
/home
[mhackett@localhost home]$ _
```

- Text Files
 - Most configuration files are text files
 - Data in the file is stored in plaintext, human-readable format
- Binary Files
 - Data in the file is stored in machine language (binary)
 - Not a human-readable format
 - Used by executable programs

- Executable Programs
 - Compiled programs that can be executed/run as processes in the system
- Directory Files
 - Each directory is a special file that organizes the text, binary, executable, and other files stored in the filesystem

- Linked Files
 - Files that are associated with each other
 - Could represent the same data or act as a shortcut to a different file
- Device Files
 - Files that represent system devices
 - Used by commands that interact with the physical device they represent

- Named Pipe Files
 - Identify channels that pass information from one process to another
- Socket Files
 - Allows a process on another computer to write to a file on the local computer while another process reads that file

Filenames

- Filenames in Linux usually consist of
 - Alphanumeric characters (a-z, A-Z, 0-9)
 - Underscores (_)
 - Dashes ()
 - Periods (.)
- May be up to 255 characters in length
- Filenames that begin with a period are hidden files, and are only seen in a directory listing when using the -a option with the 1s command.

Filename Extensions

- Filenames typically end with an extension
 - Characters that indicate the type of file

- Example: myfile.txt
 - .txt is the file's extension

A file is not required to have an extension

Extension	Description	Туре
.bin	Binary executable programs (akin to .exe programs in Windows)	Binary
.c	C source code files	Text
.cc, .cpp	C++ source code files	Text
.html, .htm	Hypertext Markup Language (web page) files	Text
.txt	Text files	Text

Extension	Description	Туре
.tar	Archive files	Binary
.gz, .bz2, .xz, .Z	Compressed files	Binary
.tar.gz, .tgz, .tar.bz2, .tar.xz, .tar.Z	Compressed archives	Binary
.conf, .cfg	Configuration files	Text
.SO	Shared object libraries	Binary
.o, .ko	Compiled objects	Binary

Extension	Description	Туре
.pl	PERL programs	Text
.tcl	Tool Command Language programs	Text
.jpg, .jpeg, .png, .gif	Graphical images	Binary
.sh	Shell scripts	Text

Extension	Description	Туре
.bin	Binary executable progams (akin to .exe programs in Windows)	
.c		
.cc, .cpp		
.html, .htm		
.txt		
.tar		
.so		
.0		

• Using the **-F** option with the **1s** command will display a listing of files in a directory, along with a special symbol that denotes each file's type.

```
No Symbol Text file, Binary file, or Device file

* Executable file

/ Directory file

@ Linked file

= Socket file

Named Pipe file
```

Executing 1s /etc produces a listing of the /etc directory

```
[mhackett@localhost home]$ ls /etc
abrt
                                fonts
                                                 magic
                                                                             request-key.d
adjtime
                                foomatic
                                                                             resolv.conf
                                                 mailcap

 We've seen the -1 option with the 1s command will display a long listing of files in a directory.

• We'll now take a closer look at what is displayed for each file.

• Executing $ls - la \sim$ to display a long listing of the current user's home directory including any hidden files.

```
[mhackett@localhost home]$ ls -la
total 28
drwx----. 14 mhackett mhackett 4096 Nov 30 14:35 .

[mhackett@localhost home]$
```

 We'll focus on the .bashrc file and .cache directory, because they appear next to each other

```
-rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc
drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache
```

The first character indicates the file's type

Device file (character device)

```
-rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache

- Text or binary file d Directory l Linked file (lowercase L) n Named Pipe file s Socket file b Device file (block device)
```

 The next ten characters indicates the file's permissions or mode

```
rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc
drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache
```

• The next value indicates the number of hard links to a file

```
-rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc
drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache
```

The next value indicates the owner of the file

```
-rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc
drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache
```

 The next value indicates the name of the group of users that own the file

```
-rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc
drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache
```

• The next value indicates the size (in bytes) of the file

```
-rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc
drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache
```

The next value indicates the date the file was last accessed.

```
-rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc
drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache
```

• The last value is the file's name.

```
-rw-r--r--. 1 mhackett mhackett 376 Aug 5 06:19 .bashrc
drwx----. 11 mhackett mhackett 226 Nov 30 14:22 .cache
```

The file command

- The **file** command provides information about a file's type
 - Syntax: **file** *filename*

```
[mhackett@localhost ~1$ pwd
/home/mhackett
[mhackett@localhost ~1$ file .bashrc
.bashrc: ASCII text
[mhackett@localhost ~1$ file .cache
.cache: directory
[mhackett@localhost ~1$ file /dev/sda2
/dev/sda2: block special (8/2)
[mhackett@localhost ~1$ file /dev/tty1
/dev/tty1: character special (4/1)
[mhackett@localhost ~1$
```

• To filter the files and directories displayed by the Is command, we can use wildcard metacharacters.

• These characters allow us to specify file and directory names that match a certain pattern.

Wildcard Metacharacters	Description
*	Matches 0 or more characters in the name
?	Matches 1 character in the name
[abd]	Matches 1 character in the name, which must be a, b, or d
[a-d]	Matches 1 character in the name, which must be a, b, c, or d
[a-dA-D]	Matches 1 character in the name, which must be a, b, c, d, A, B, C, or D
[0-5]	Matches 1 character in the name, which must be 0, 1, 2, 3, 4, or 5
[!a-d]	Matches 1 character in the name, which must NOT be a, b, c, or d

 We'll first try to do a long listing all files and directories in the /etc folder that begin with the letter h

 Executing 1s -1 h will return no results because there is no file named h in /etc

```
[mhackett@localhost ~1$ ls -1 /etc/h
ls: cannot access '/etc/h': No such file or directory
[mhackett@localhost ~1$ _
```

- Executing 1s -1 /etc/h* will return:
 - Any files and directories in /etc that begin with h, followed by any series of characters (including no characters)

```
[mhackett@localhost ~]$ ls -l /etc/h*
                            -rw-r--r-. 1 root root 9 Oct 9 04:18 /etc/host.conf
      3 Files
                             rw-r--r--. 1 root root 22 Nov 30 13:57 /etc/hostname
                            -rw-r--r--. 1 root root 158 Oct 9 04:18 /etc/hosts
                            /etc/hp:
                            total 4
2 Directories
                            -rw-r--r--. 1 root root 999 Nov 28 10:21 hplip.conf
                            /etc/httpd:
                            total O
                            drwxr-xr-x. 2 root root 37 Nov 30 13:51 conf
                            drwxr-xr-x. 2 root root 104 Nov 30 13:51 conf.d
                            drwxr-xr-x. 2 root root 251 Nov 30 13:51 conf.modules.d
                            lrwxrwxrwx. 1 root root 19 Nov 21 12:13 logs -> ../../var/log/httpd
                            lrwxrwxrwx. 1 root root 29 Nov 21 12:13 modules -> ../../usr/lib64/httpd/modules
                            lrwxrwxrwx. 1 root root 10 Nov 21 12:13 run -> /run/httpd
                            lrwxrwxrwx. 1 root root 19 Nov 21 12:13 state -> ../../var/lib/httpd
                            [mhackett@localhost ~1$ _
```

- Executing 1s -1 /etc/ho* will return:
 - Any files and directories in /etc that begin with ho, followed by any series of characters (including no characters)

- Executing **ls** -1 /bin/l? will return:
 - Any files and directories in /bin that begin with I, followed by any one character

```
[mhackett@localhost ~1$ ls -1 /bin/l?
-rwxr-xr-x. 1 root root 85912 Oct 17 03:37 /bin/ln
lrwxrwxrwx. 1 root root 26 Nov 30 13:50 /bin/lp -> /etc/alternatives/print-lp
-rwxr-xr-x. 1 root root 157984 Oct 17 03:37 /bin/ls
lrwxrwxrwx. 1 root root 2 Jul 26 07:40 /bin/lz -> uz
```

- Executing **ls** -**l** /**bin**/**l**?? will return:
 - Any files and directories in /bin that begin with I, followed by any one character, followed by any one character

```
[mhackett@localhost ~1$ ls -1 /bin/1??
-rwxr-xr-x. 1 root root 5441 Nov 19 12:33 /bin/ldd
lrwxrwxrwx. 1 root root 27 Nov 30 13:50 /bin/lpq -> /etc/alternatives/print-lpq
lrwxrwxrwx. 1 root root 23 Nov 30 13:50 /bin/lpr -> /etc/alternatives/print
-rwxr-xr-x. 1 root root 24984 Jul 25 20:25 /bin/lua
-rwxr-xr-x. 1 root root 188272 Aug 18 04:49 /bin/lz4
```

- Executing **ls** -**1** /**bin**/**1**[**pn**] will return:
 - Any files and directories in /bin that begin with I, followed by either p or n

- Executing ls -1 /bin/l?[dq] will return:
 - Any files and directories in /bin that begin with I, followed by any one character, followed by either d or q

```
[mhackett@localhost ~1$ ls -1 /bin/1?[dq]
-rwxr-xr-x. 1 root root 5441 Nov 19 12:33 /bin/ldd
| lrwxrwxrwx. 1 root root = 27 Nov 30 13:50 /bin/lpq -> /etc/alternatives/print-lpq
```

- Executing ls -1 /bin/l?[d-z] will return:
 - Any files and directories in /bin that begin with I, followed by any one character, followed by a character between d and z

```
[mhackett@localhost ~1$ ls -l /bin/l?[d-z]
-rwxr-xr-x. 1 root root 5441 Nov 19 12:33 /bin/ldd
lrwxrwxrwx. 1 root root 27 Nov 30 13:50 /bin/lpq -> /etc/alternatives/print-lpq
lrwxrwxrwx. 1 root root 23 Nov 30 13:50 /bin/lpr -> /etc/alternatives/print
```

- Executing ls -1 /bin/l?*[!c-z] will return:
 - Any files and directories in /bin that begin with I, followed by any one character, followed by any number of characters, and ends with a character that is not in c through z

- The **cat** command is used to display the contents of a text file in the terminal.
- Syntax: cat [options] argument(file)

```
[mhackett@localhost ~1$ cat /etc/networks default 0.0.0.0 loopback 127.0.0.0 link-local 169.254.0.0
```

The cat command's -n option will display line numbers.

- The **tac** command is used to display the contents of a text file (in reverse) in the terminal.
- Syntax: tac [options] argument(file)

```
[mhackett@localhost ~1$ tac /etc/networks
link-local 169.254.0.0
loopback 127.0.0.0
default 0.0.0.0
[mhackett@localhost ~1$
```

- Some text files are very big and we may wish to step through the text file more slowly.
 - For example, the file /var/log/dnf.log (currently on my system) has
 235 lines which all get displayed at once

```
cat -n /var/log/dnf.log
```

```

q Quits/Exits the less command

h Help Menu

- To view a binary file, you typically need to open the file with a program that understands the binary information contained in the file.
 - It is not safe to try to read a binary file with text display programs like cat and less.

- The **strings** command takes a binary file and tries to retrieve any human-readable text from the file's data.
 - The text is displayed in the terminal

Syntax: strings [options] argument(file)

 For example, the command strings /bin/ls would display any text contained inside of the binary executable ls program

Another way to view a binary files is with the od command.

• The **od** command takes a binary file and displays it in octal (base 8)

Syntax: od [options] argument(file)

 For example, the command od /bin/cd would display the binary executable cd program's data in base 8

```
[root@localhost ~]# od /bin/cd
0000000 020443 072457 071163 061057 067151 071457 005150 072542
0000020 066151 064564 020156 062143 021040 040044 005042
0000036
[root@localhost ~]#
```

The -x option will display the data in hexadecimal
 od -x /bin/cd

```
[root@localhost ~]# od -x /bin/cd
0000000 2123 752f 7273 622f 6e69 732f 0a68 7562
0000020 6c69 6974 206e 6463 2220 4024 0a22
0000036
[root@localhost ~]# _
```

 The most common tool for searching for text in text files is the grep command

Syntax: grep [options] expression file(s)

 The command grep hackett /etc/passwd would search the /etc/passwd file for any lines that contain the literal text "hackett" and display the lines to the terminal

```
[root@localhost ~]# grep hackett /etc/passwd
m<mark>hackett</mark>:x:1000:1000:Michael Hackett:/home/m<mark>hackett</mark>:/bin/bash
[root@localhost ~]# _
```

- The **grep** command makes use of **regular expressions** (patterns of text) in its searching.
 - Global regular expression print
- Regular expressions (*regexp*) are similar to wildcard metacharacters, except they are interpreted by text tools and not the shell.
 - Common regular expressions available to most text tools
 - Extended regular expressions less common and not available to all text tools

Regexp	Description	Example	Туре
*	Matches 0 or more occurrences of previous character	test* matches tes, test, testt, testtt, testtt, and so on	Common
?	Matches 0 or 1 occurrences of the previous character	test? matches tes, test	Extended
+	Matches 1 or more occurrences of the previous character	test+ matches test, testt, testtt, and so on	Extended
•	Matches any 1 character	test. matches test1, test2, test3, and so on; testa, testb, testc, and so on	Common
[]	Matches any 1 character in the range specified	test[2468] matches test2, test4, test6, test8 test[g-j] matches testg, testh, testi, testj	Common

Regexp	Description	Example	Туре
[^]	Matches any 1 character NOT specified in the range	test[^2468] matches test1, test3, test5, test7, test9, test0, testa, testb, testc, and so on	Common
{ }	Matches a specific number or range of the previous character	test{3} matches testtt test{1,3} matches test, testt, testtt	Extended
٨	Matches the following characters if they are the first characters of a line	^test matches any line that starts with test	Common
\$	Matches the previous characters if they are the last characters of a line	test\$ matches any line the ends with test	Common
()	Matches either of two sets of characters	(test1 test2) matches either test1 or test2	Common

- grep's -s option suppresses any warnings.
 - Useful for ignoring grep operations on directory files
- The command grep -s hackett /etc/* will search through all files and directories in the /etc directory and print any lines from text files that contain the text "hackett"

```
[root@localhost ~]# grep -s hackett /etc/*
/etc/group:mhackett:x:1000:
/etc/gshadow:mhackett:!::
/etc/passwd:mhackett:x:1000:1000:Michael Hackett:/home/mhackett:/bin/bash
/etc/shadow:mhackett:$6$3/RDoshAeMsJFoFm$jaPfUWIrvauViwtFspg1K/IxlsifLKCEGZNGNF
FxStImOkRrisPo6UvMHTLcWONo/::0:99999:7:::
/etc/shadow-:mhackett:$6$3/RDoshAeMsJFoFm$jaPfUWIrvauViwtFspg1K/IxlsifLKCEGZNGN
HFxStImOkRrisPo6UvMHTLcWONo/::0:99999:7:::
/etc/subgid:mhackett:100000:65536
/etc/subuid:mhackett:100000:65536
[root@localhost ~]# _
```

grep -s hackett /etc/sub*

 Any lines that contain the pattern "hackett" in files that start with "sub" in the /etc directory

```
[root@localhost ~]# grep -s hackett /etc/sub*
/etc/subgid:mhackett:100000:65536
/etc/subuid:mhackett:100000:65536
[root@localhost ~]# _
```

- grep's -c option prints the number of times a pattern appears in a file.
- The command grep -c bash /etc/passwd will print the total number of lines in the passwd file that contains the pattern bash

```
[root@localhost ~]# grep bash /etc/passwd
root:x:0:0:root:/root:/bin/bash
mhackett:x:1000:1000:Michael Hackett:/home/mhackett:/bin/bash
[root@localhost ~]# grep -c bash /etc/passwd
2
[root@localhost ~]# _
```

- grep's -i option ignores casing.
- The command grep -i hackett /etc/passwd will print the lines in the passwd file that contains the pattern hackett, regardless of casing

```
[root@localhost ~]# grep -i hackett /etc/passwd
mhackett:x:1000:1000:Michael Hackett:/home/mhackett:/bin/bash
[root@localhost ~]# _
```

• If your pattern contains a space, be sure to put it in double quotes.

```
grep -s "Michael Hackett" /etc/*
```

```
[root@localhost ~]# grep -s "Michael Hackett" /etc/*
/<mark>etc/passwd:mh</mark>ackett:x:1000:1000:<mark>Michael Hackett</mark>:/home/mhackett:/bin/bash
[root@localhost ~]# _
```

 When searching using a regular expression, quotes are also required.

```
grep -s "/bin/s.*" /etc/*
```

Searches every file in the /etc directory for lines that contain the pattern: /bin/ followed by 1 s and followed by any number of

characters.

```
[root@localhost ~]# grep -s "/bin/s.*" /etc/*
/etc/anacrontab:SHELL=/bin/sh
/etc/brltty.conf:#speech-driver gs  # GenericSay (pipes to /usr/local/bin/say)
/etc/brltty.conf:#speech-parameters gs:Command=/usr/local/bin/say
/etc/passwd:sync:x:5:0:sync:/sbin:/bin/sync
/etc/passwd-:sync:x:5:0:sync:/sbin:/bin/sync
/etc/sestatus.conf:/bin/sh
/etc/shells:/bin/sh
/etc/shells:/usr/bin/sh
/etc/shells:/usr/bin/sh
/etc/sudoers:# Cmnd_Alias SERVICES = /sbin/service, /sbin/chkconfig, /usr/bin/systemctl
bin/systemctl stop, /usr/bin/systemctl reload, /usr/bin/systemctl restart, /usr/bin/systemctl
, /usr/bin/systemctl enable, /usr/bin/systemctl disable
```

```
grep -s "/bin/s[^y]" /etc/*
```

Searches every file in the /etc directory for lines that contain the pattern: /bin/s followed by any character that is not y.

```
[root@localhost ~]# grep -s "/bin/s[^y]" /etc/*
/etc/anacrontab:SHELL=/bin/sh
/etc/brltty.conf:#speech-driver gs  # GenericSay (pipes to /usr/local/bin/say)
/etc/brltty.conf:#speech-parameters gs:Command=/usr/local/bin/say
/etc/sestatus.conf:/bin/sh
/etc/shells:/bin/sh
/etc/shells:/usr/bin/sh
[root@localhost ~]#
```

• For extended regular expressions, the -E option is required. grep -sE "/bin/s?" /etc/shells

Searches the shells file in the /etc directory for lines that contain the pattern: /bin/ followed by 0 or more s's

```
[root@localhost ~]# grep -sE "/bin/s?" /etc/shells
/bin/sh
/bin/bash
/usr/bin/sh
/usr/bin/bash
[root@localhost ~]#
```

- Other common grep options:
 - Output the lines that do NOT match the pattern
 - -1 Only print the files that have matching lines
 - -o Only print the matching part of the line
 - -F Ignore regular expression characters in the search pattern

- Other tools commonly used for searching and manipulating text files are sed and awk
 - We may see them in later lectures, but an entire 4-credit course could be devoted just to them
- Both are worth you becoming somewhat proficient with if you plan on a possible career in Unix/Linux systems administration

- The most common CLI text editor on Linux and Unix systems is
 vi ("vee eye")
 - A similar program, **vim** (**v**i **im**proved), is installed on most Linux systems.
 - Entering the vi command will open vim, if vim is installed.

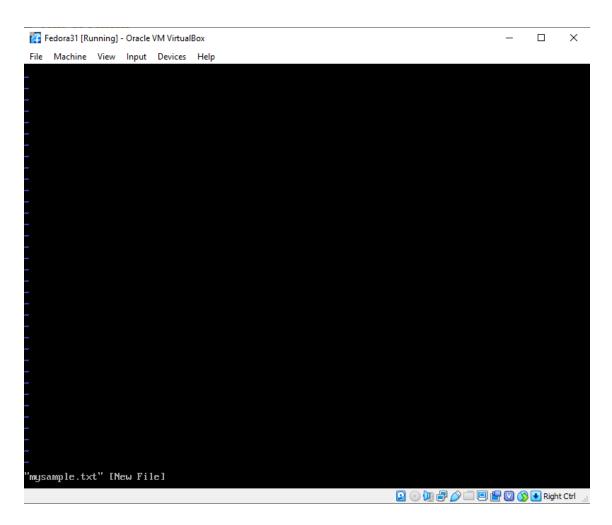

The following syntax is used to open a file in vi
 vi file

- If the file does not exist, it will be created
 - Provided the user has permission to create new files in the current directory

• Entering the command vi mysample.txt will open this file named mysample.txt (or create it if it doesn't exist)

- This assumes the user is in the same directory as the file.
 - If it is in a different directory, a path must be provided
 - For example, vi ~/mysample.txt would open/create the file if it was in the user's home directory

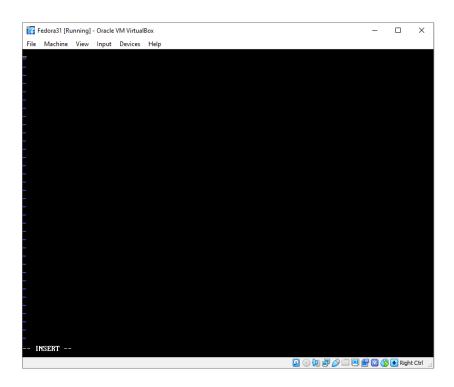

vi mysample.txt

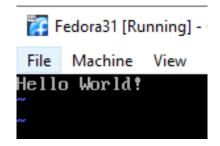

- Vi has four modes:
 - Insert Mode
 - Command Mode
 - Execute Mode
 - Visual Mode
- To enter Command Mode, press the Escape key
 - Vi opens in Command Mode
- To enter Insert Mode, press the i key (while in Command Mode)
- To enter Execute Mode, press the : key (while in Command Mode)
- To enter Visual Mode, press the v or V key (while in Command Mode)

- After pressing the i key, I am put in insert mode.
 - Allowing me to edit the file

• After making any changes, I can save and exit vi.

- Change to Command Mode (Escape)
 - Press the colon key (Shift+;) to enter Execute Mode

Common Execute Mode commands (press Enter after each)

:w Write/save the file

:w filename Writes/saves the file as the specified filename

:q! Exits vi without saving changes

:wq Exits vi and saves the file

:set nu Turns line numbers on

:set nonu Turns line numbers off

:\$ Goes to the last line

:1 Goes to the first line

:number Goes to this line number (:4 would go to the fourth line)

Common Command Mode Navigation keys

h Move one character left

I Move one character right

j Move one line down

k Move one line up

^ Move to the beginning of the current line

\$ Move to the end of the current line

w Move to the next word in the line

b Move to the previous word in the line

gg Move to the first line of the file

Shift+G Move to the last line of the file

Common Command Mode Editing keys

X Delete the character selected by the cursor

numberx Delete this number of characters after (and including) this character

dd Delete the current line

dnumber Deletes this number of lines after (and including) the current line

yy Copies the current line

ynumber Copies this number of lines after (and including) the current line

Pastes copied or deleted line(s) below the current line
Pastes copied or deleted line(s) above the current line

u Undo the last change

U Undo all changes on the current line

/text Finds occurrences of the specified text (n to go forward; N to go backward)

:s/pattern/replacement/g Replaces all occurrences of pattern with the replacement text

After executing :w

```
"mysample.txt" [New] 1L, 13C written
```

 Then after executing :q, vi closes and I'm placed back at the command prompt

```
~
[mhackett@localhost ~1$
```

 The command cat mysample.txt will show the data saved to the file.

```
[mhackett@localhost ~1$ cat mysample.txt
Hello World!
[mhackett@localhost ~1$
```

- Other commonly used text editors
 - (Command Line) GNU nano
 - (Command Line) GNU Emacs (Editor Macros)
 - (Graphical Text Editor, GNOME desktop) gedit
 - (Graphical Text Editor, KDE desktop) kate

- It's worth having some exposure to nano and emacs
 - Ultimately, the text editor you use comes down to preference
 - You should absolutely be somewhat proficient with vi, though.
